Creating innovators
Tony Wagner
Scribner, 2014

This book focuses on studying how to create the next generation of innovators. To this end, the author conducted interviews with young people from the so-called 'network generation' to understand how they were motivated and what type of teaching and leadership they responded to positively. The book shows how the new generations' innovations can create value for companies and for themselves. Wagner believes that the essential qualities of an innovator can be instilled, taught and mentored, and consequently, people can become more creative and innovative if right the environment and opportunities are provided.

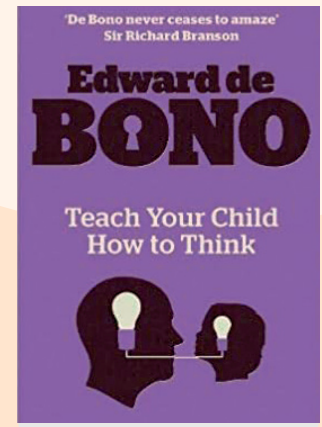

Pensar para aprender en el aula
Robert Swartz
Ediciones SM, 2019

This book is a set of real lessons in which teachers trained in Thinking-Based Learning (TBL) teach their students to be good thinkers. It recounts the implementation of collaborative thinking, in which ideas are shared and discussed in groups connected by a feeling of empathy and a desire to find the best solution to a problem together. The role of teachers who guide and motivate their learning is key to achieving this. This methodology teaches students to use thinking skills both in the classroom and in any other area of life.

Lateral Thinking
Edward De Bono
Penguin Books, 2016

Lateral thinking is creative thinking with infinite ways of reaching a solution, because it uses the brain in a different way without using logic. This book examines why the current way of thinking is not good enough and what can be done to change it. De Bono argues that while current thinking methods work when applied to specific areas such as science and technology, they actually hinder progress when attempting to address less scientific ones. It is a book with new ideas to demonstrate the power that comes from the ability to think differently.

Teach your Child How to Think
Edward De Bono
Penguin Books, 2009

This book shows that there are many extremely intelligent people who get trapped in their own talent, making them deficient thinkers. De Bono argues that thinking is one more skill that can be taught to children. With this story, the author provides a series of tips to encourage thinking that will profoundly and beneficially influence the child's entire life. It shows how to educate young people to productively develop their talents and skills.

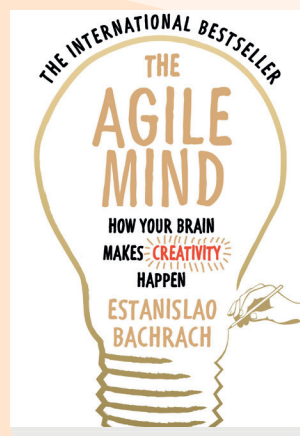

La creatividad. Atrévete a tener buenas ideas
Maria Batet
Edicions Culturals Andana, 2018

We like to have good ideas, and yet there is a widespread belief that the ability to have them is only available to a privileged few. Although the ability to create is inherent, we are trained more for critical thinking than for creative thinking. This book, with its short, direct and thought-provoking texts and simple, clear illustrations, presents the essential elements that will make you dare to have more and better ideas.

ImaginAcción
Nacho Ros
Kolima, 2019

The ImaginAcción method ingeniously and effectively combines creative thinking, emotional education, art education, imagination, cooperative learning and service-learning. Developed in a didactic and innovative way, this method has been tested in different schools, where it has improved the students' social and creative behaviours, as well as leading to a major increase in the motivation of both the students and the teachers. The book offers a wide variety of original ideas and teaching resources to apply in the classroom or at home.

The Agile Mind
Estanislao Bachrach
Transworld Publishers, 2016

Recent advances in neuroscience have shown that by applying the right techniques, the mind can modify the structure and configuration of the brain. Creativity can be expanded, and therefore, everyone can be creative to succeed and live better. It is just a matter of exercising the brain to learn how to think. This book shows the mechanisms of the process of learning how to develop one's full potential, how to use the senses, expand memory, focus attention, control negative emotions and enjoy positive ones.

Dibujar para aprender
Garbiñe Larralde
Graó, 2022

This book, inspired by Visual Thinking, invites the reader to draw to learn and opens up a universe of possibilities yet to be explored. The world is changing, and many students speak the visual language, which is why it should be given greater prominence in the educational system. This book aims to enrich academic knowledge with tasks that facilitate access to knowledge to people who think in other ways, such as people who want to experiment with drawing as a tool to represent ideas.
